

Tall Buildings: **Prevention** at the Design Stage – The view of an Occupational Safety and Health Expert

Carl Heyrman
Nicosia, Cyprus
January 14, 2017

Where I come from

Antwerp

Tall buildings of Antwerp

Cathedral

- Year: 1352-1521
- Height: 123 m

Tall buildings of Antwerp

‘Tower building’

- Year 1929-1932
- Height: 87,5m
- Highest skyscraper of Europe in 1932

Tall buildings ... New buildings?

Empire State Building NY

- Ready in 1931
- 20 months from start to finish
- 3400 workers simultaneously
- At least 5 fatal accidents

Design and prevention

Construction life cycle

- Design stage
- Procurement stage
- Construction stage
- Use and maintenance stage
- Demolition stage

Direct parties concerned

- Client - Owner
- Designer
- Contractor
- Construction worker
- Site manager
- Supplier
- Safety expert
- ...

Role and impact of the designer

- Over 60%^(*) of fatal accidents could have been avoided by taking action before opening the construction site
- Article 9 of the 167th ILO Convention:
The designer must consider safety and health protection for construction workers
- EU 92/57
- The decisions taken during the initial cycles are the most strategic

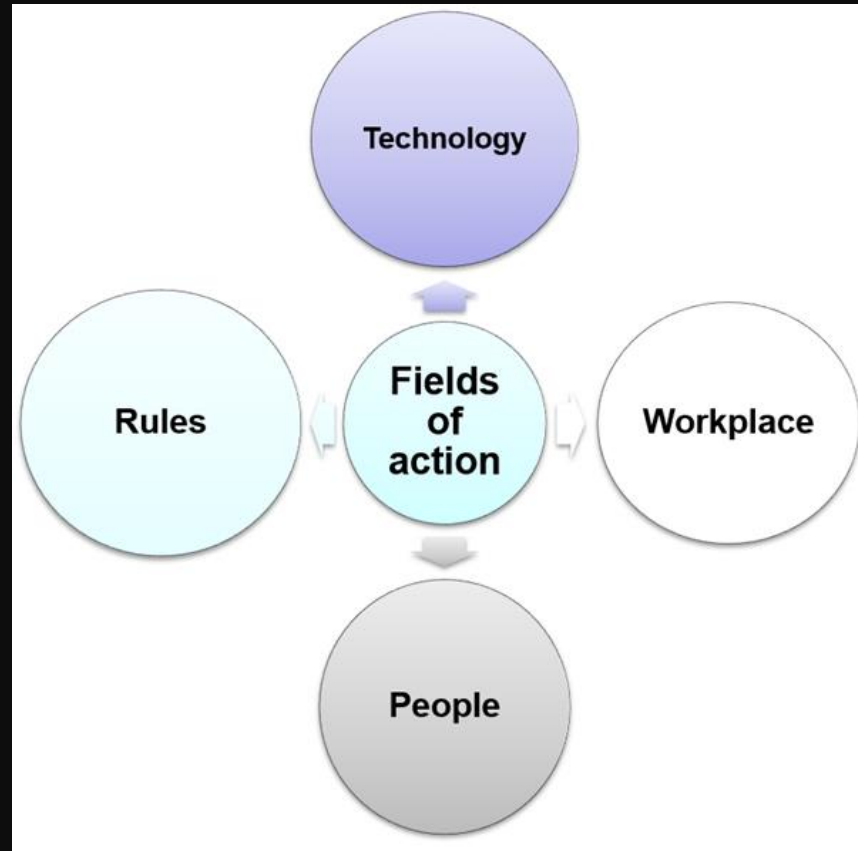

^(*) Source: ISSA-C

Role of the designer

Designers must **study** how the structure can be built, used, maintained, renovated and finally demolished **safely**

Management of Health and Safety: Fields of action

Example: pre-fabrication

- Pre-fabrication and pre-assembly will likely increase worker safety
- Pre-fabrication reduces work at height

Recommendation 1

Be aware of the
difference you can
make as a **designer**
regarding SH

Our old friends

Sir Isaac Newton (1643–1727)

Newton's first law: law of inertia

The first law can be stated mathematically when the mass is a non-zero constant, as,

$$\text{SUM}(F)=0 \iff dv/dt=0$$

Consequently

- An object that is at rest will stay at rest unless a force acts upon it
- An object that is in motion will not change its velocity unless a force acts upon it

Newton's second law

- $F = m \cdot dv/dt = m \cdot a$

Derived

- $G = m \cdot g$

Newton

(kg.m/s²)

Where

- $g = 9,81 \text{ m/s}^2$ = acceleration of free fall
- m = mass of the body
- G = Weight of the body

Newton's third law

- To every **action** there is always opposed an equal **reaction**

or

- The mutual actions of two bodies upon each other are always equal, and directed to contrary parts

Potential Energy

$$E_p = m \cdot g \cdot h$$

Joule

(kg.m/s².m= N.m)

Kinetic Energy

$$E_k = \frac{1}{2} m v^2$$

Joule

(kg.m/s².m= N.m)

Law of conservation of mechanical Energy

$$E = E_p + E_k$$

Joule

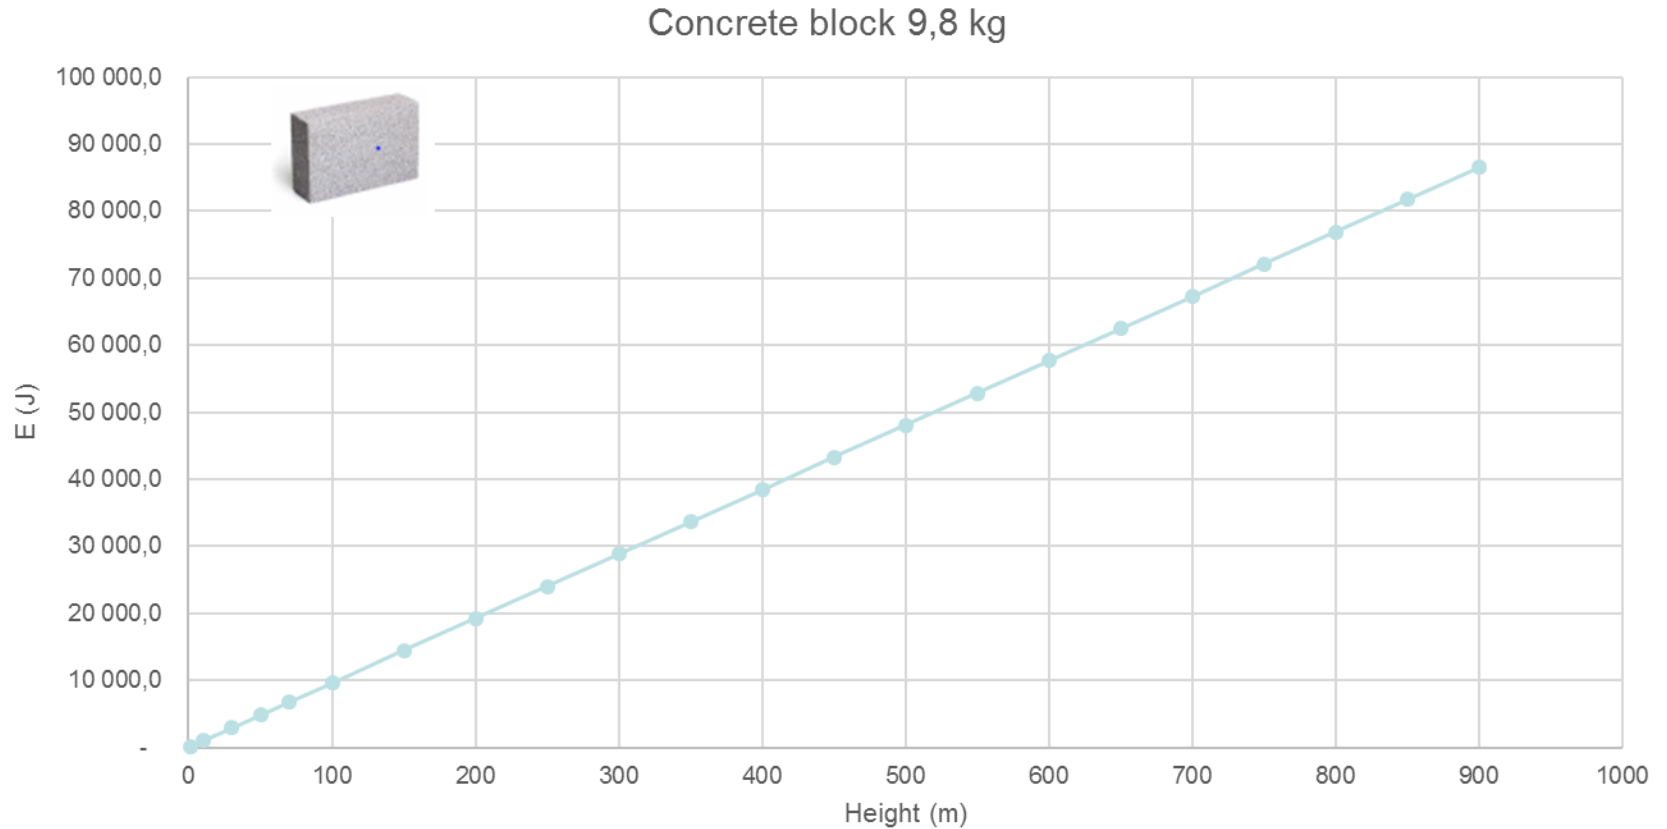

(kg.m/s².m= N.m)

Impact on human head

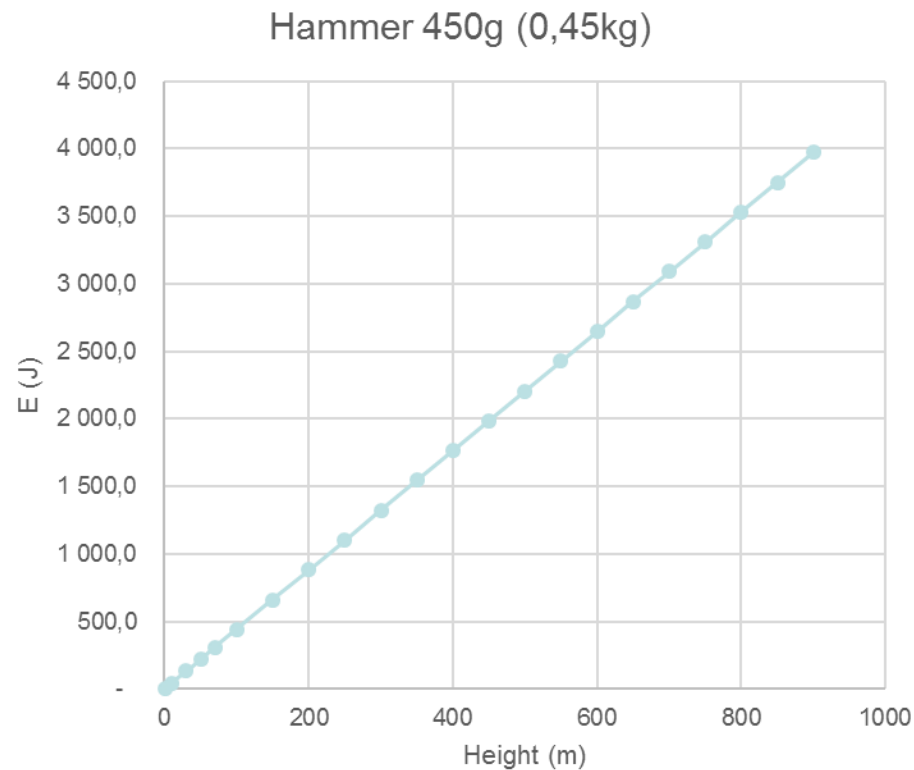

University Bern (CH)

- 100J: Fracture of human skull
- 200J: Fatal

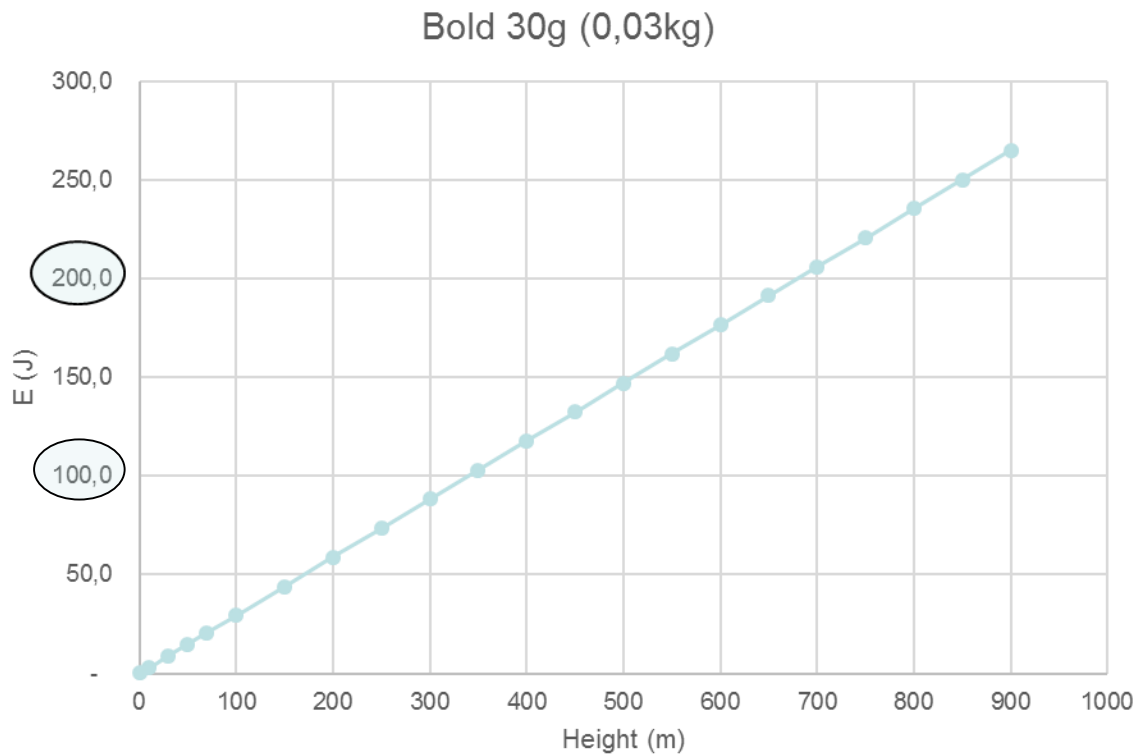

Impact of a concrete block

Impact of fall of a hammer of 450g

Impact of fall of a bold of 30g

Recommendation 2

**Stop dropped
objects**

Preventing dropped objects

Safety nets

Related projects

Art No. (Made to Order Only)

The Safety Net Fan High Rise has been designed specifically for the High Rise construction industry and can withstand winds of up to 100mph

It utilises the Class B1 net and comes with 60 x 60mm mesh and 20mm x 20mm debris net as standard, which has been proven to arrest falls of up to 100kg from a height of 6m, conforming to EN1263-1&2 (Safety Nets).

The elasticity of the net, together with a slight deformation of the frame, ensures that the impact of a fall is absorbed, considerably decreasing the risk of injury or objects falling to street level. Items do not bounce out or shatter which can harm people and property below. B1 nets that comply with EN1263-1&2 are significantly stronger than conventional methods of protection, as well as being energy absorbent, absorbing up to 4.4 kJ.

The combined layer net is able to catch considerably smaller particles of debris therefore protecting property and people at ground level. Fans can be folded in to retrieve fallen objects.

- Designed to withstand wind gusts of up to 100mph
- Made for catching material
- Compliments high rise construction
- 60mm x 60mm net overlay with 20 mm x 20mm* debris netting.
- 6m long by 4.6m wide
- High energy absorbing nets and frame assembly
- Folds up against the facade for easy crane access below or as a safety precaution during bad weather

*on the main inner section only, not on the kicker 'Up section'

NOTE: This product is a special solution, made to order only.

The **force** of nature

Wind and structural design

- Structural integrity under ultimate loads
- Deflections under service loads
- Building motion and occupant comfort
- Uncertainties in building structural properties like stiffness and damping
- Uncertainties in wind loading
- Uncertainties in wind climate
- Fluid dynamics

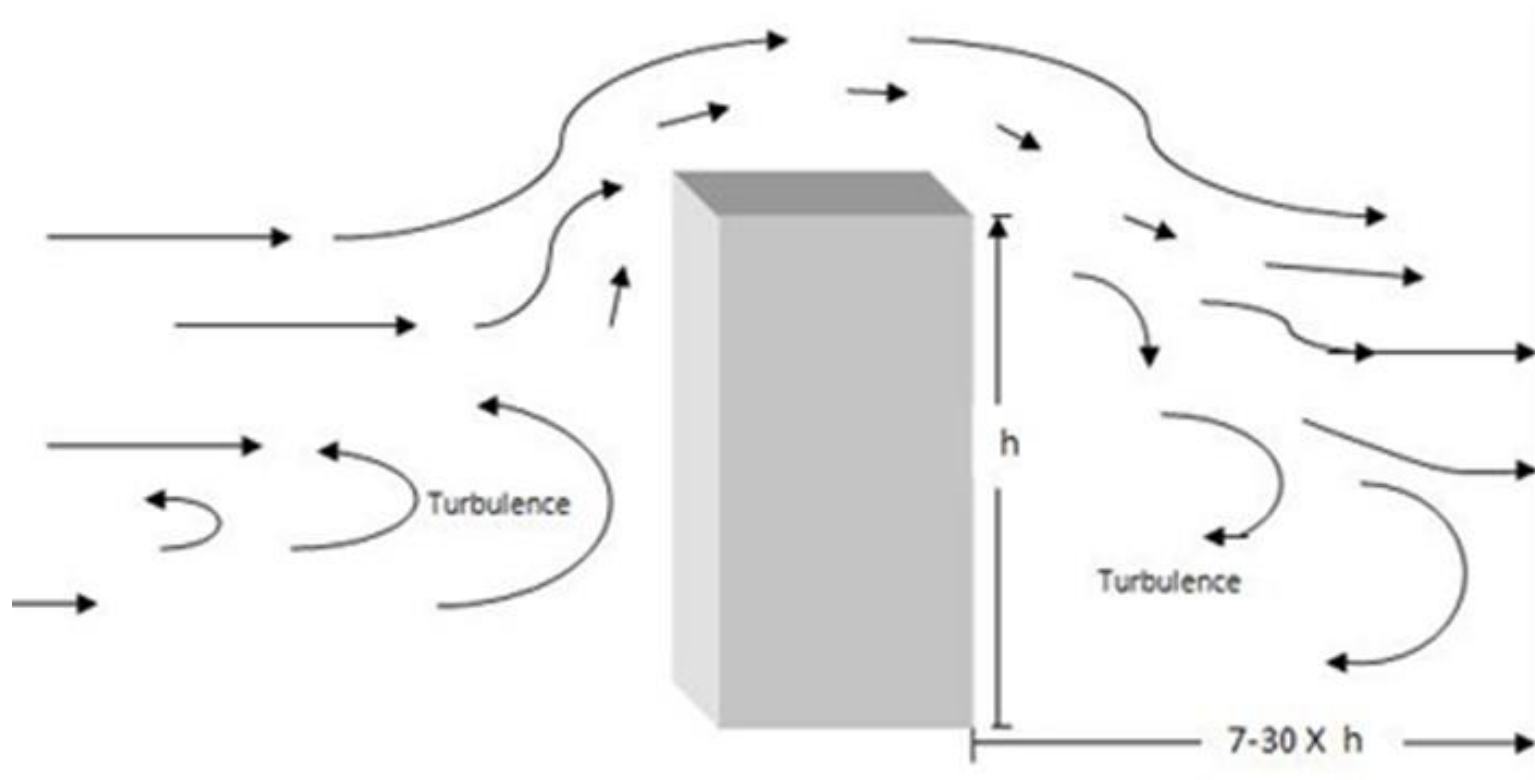

Relationship between height and the importance of wind loads

What about scaffolds?

From: Worksafe Victoria (Australia)

eurconsult

Recommendation 3

**Assess the impact of
wind also on
scaffolds, platforms
and temporary
structures**

Make sure that...

- All scaffolds in wind exposed locations are designed to withstand likely environmental loads, including wind and rain.
- The design of a sheeted scaffold in any wind-exposed location is approved by a competent person.
- Where buildings or structures are being demolished, any adjacent scaffold is also progressively dismantled or, when it is still required, that it has been appropriately strengthened to withstand any increased wind loads.
- Planks on high scaffolds in wind-exposed locations are properly fixed against uplift.

**When different people are working
together**

Cultural diversity

Same gestures... different meanings

Languages and communication

The background is a detailed Renaissance-style painting of the Tower of Babel. The tower is a massive, multi-tiered structure made of stone and brick, spiraling upwards into a cloudy sky. It features numerous windows, arches, and intricate architectural details. At the base of the tower, a large crowd of people in period clothing is gathered, some looking up at the structure. The surrounding landscape includes green hills, a body of water with several boats, and distant mountains under a blue sky with soft clouds.

15

De meeste constructiefouten worden gemaakt door slechte samenwerking en miscommunicatie. Dat blijkt uit grootschalig onderzoek onder bouwvakkers, door de TU Delft.

Miscommunication can also lead to accidents

Fatal accidents in Construction in the US (CPWR)

Migrant workers (Hispanic)	Proportion of fatal accidents	Year
6,5%	11,2%	1992
15%	23,5%	2000

Possible explanations

- ...
- Less knowledge of English
- ...

Story of the Belgian Construction Industry in 2014

- 151.061 blue collar workers on a Belgian pay roll
- 87,792 foreign workers

Accidents in the Belgian construction industry (Frequency Index)

What about the accident figures for foreign workers?

Observations made by Navb-Cnac

- Communication problems
 - Some workers do not speak the national **languages**, nor English
 - Therefore, safety instructions are not understood, Belgian **regulations** are not known
 - Communication with Belgian workers and site managers is **complicated**
- The **taller** the construction site, the more **diverse** it is

Recommendation 4

**Be aware of
diversity**

Managerial aspects

Management of Health and Safety: Fields of action
