

The Cyprus University of Technology with the CYENS Centre of Excellence and the UK High Commission are inviting you to attend the presentation

Towards Circular Construction Education based on the Constructionarium model

By Ms Julia Stevens
Director of Constructionarium UK

Abstract:

The construction industry is well known for the use of materials and the voluminous waste from construction processes. The potential for infusing Circular economy principles in design and construction processes, can have great impact in reducing Construction and Demolition waste, promote the reuse of material and reduce strain in local supply and demand for construction materials. The absence of CE standards for construction and experience in circular processes (excluding recycling), makes the adoption of such CE practices extremely difficult.

The Constructionarium has been a leader in experiential (practice-based) learning for Civil Engineering and Architectural students in the UK. This workshop will seek to expand the benefits of Constructionarium learning objectives to include Circular Economy construction projects and propose a potential collaboration with HEIs in Cyprus as well as other Cyprus-based industry stakeholders with Constructionarium Ltd (UK).

RESERVE YOUR SEAT VIA EVENTBRITE
